

Service Integration: How Deploy an Application

Gefördert durch:

IIP-Ecosphere Platform

Deploy the Application

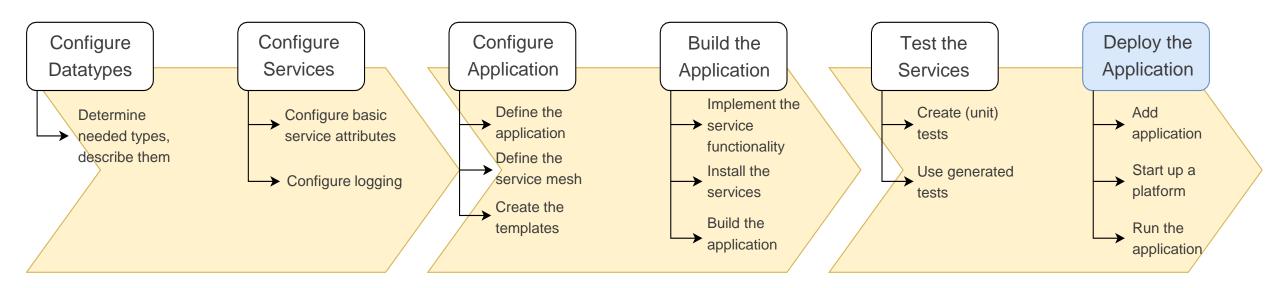

Table of Contents

- Prerequisites
- Building an Application

Prerequisites

- Required:
 - Installed the platform and its dependencies or the development container
 - Installed the IDE for IIP-Ecosphere Platform (provided Eclipse Version)
 - How to configure datatypes
 - How to configure services
 - How to configure an application
 - How to build an application
 - How to test an application
- Optional:
 - None

Table of Contents

- Prerequisites
- Starting the platform

Deploy the application on a local platform

- We assume a build platform
- In "tools/Install/gen/broker" start the broker.bat
- In "tools/Install/gen" start in order (always wait till the process says its running)
 - platform.bat
 - ecs.bat
 - serviceMgr.bat
- cli.bat
 - •Run "resources list"
 - Back out of resources with "..." Run "services <resourceID>
 - •Run "add file:///<pathToBuild-bin.jar>" (including the "-bin.jar" itself)
 - •Run "listArtifacts"
 - Run "startAll <artifactID>"

Already running in the development container

Observe the application on a local platform

- On the startup each service will list where its log files will be located
 - They are in "/tmp/<numbers>/"
 - Each directory contains a sdtout_0.log and a stderr_0.log
 - Java will only show exceptions in the stderr and outputs in stdout
 - Python will show outputs as well as errors in the stderr

Summary

- What we learned
 - How to start a platform locally
 - How to deploy our application on it
- How to go on
 - You are done
 - Optional: How to create an application with Python services
